**Site report for Ventilation Plant
Amino Chemicals Ltd., A61 Factory**

Fig. 1 : Existing location of proposed units

Existing situation on site

The proposed Air handling units shall be located at roof level over an existing office block constructed over two floors at Marsa A61 Factory, Marsa Industrial Estate. The floor of the roofing comprises a torch-welded bituminous membrane over the existing roof screed.

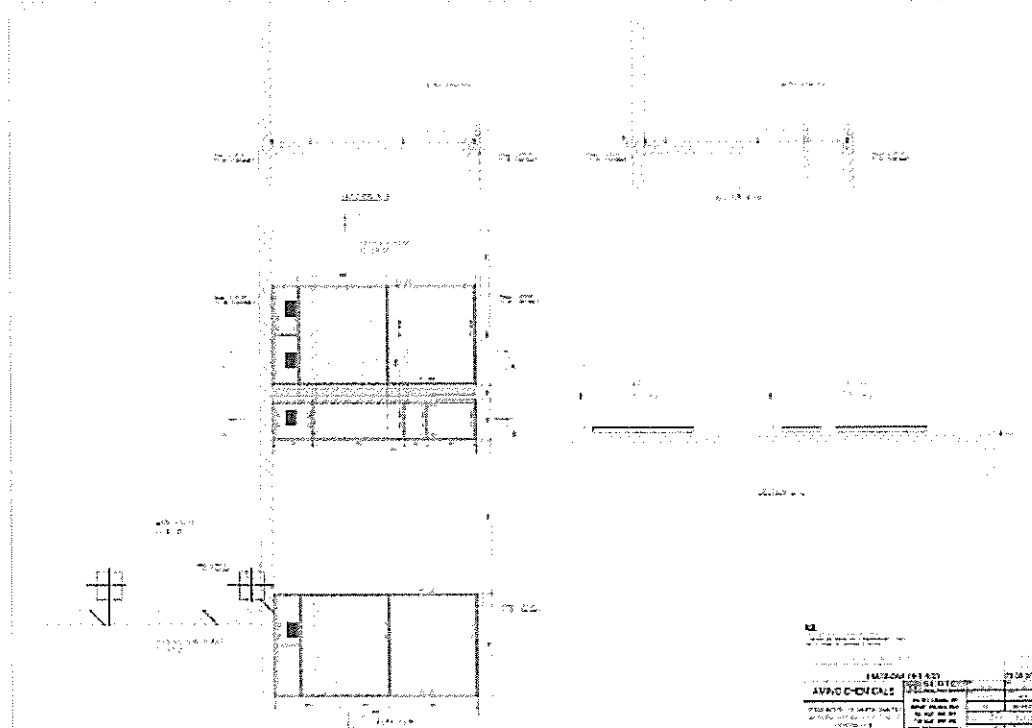

Fig 2 : Proposed layout plans

Proposed air handling units

The air handling units are intended to provide forced fresh air ventilation and extraction to a section of the production facility within the A61 Factory. The proposed air handling units shall be located on a separate structure at roof level. The units are so located to be screened from vision by the existing factory gabled roof top. In fact, the height of the units shall be limited not to exceed the highest point of the facility.

All the necessary walk ways and railings shall be installed to ensure a safe operating environment at roof level.

There shall be no toxic fumes or waste liquids of any sorts deriving from the units. Since the units shall be located at roof level, there is no risk of accidental damage resulting from any related activities on site.
