

DEBONO ENTERPRISES LTD.

HM 19, Triq il Pluvieri, Zurrieq.

Date : 20/08/2021

Ref : Environment Permit EP 0018/21

**Dust Mitigation measures:**

- i) It is noted that during a South wind direction at Beaufort scale force 7, the crushers will not normally operate, and instead, routine maintenance is performed. Hence this action will prevent any major airborne dust.
- ii) Both mobile crushers are installed around 20 meters and 35 meters respectively below street level and hence very well shielded from normal windy days unlike above street level sites.
- iii) During the 3 summer month period, the nearby water tanks are used when needed to wet the lower-level bases and by the time an outgoing truck is up the ramp and is about to exit the site we have a 12 meter concrete floor exit gradient tilted inward to site which the ERA inspectors have noted. Occasionally when needed, a water bouser is used, otherwise the public road exit is always clean.
- iv) A conveyor belt is presently covered, and it is intended to add another cover where possible depending on the mechanical movement and clearance of conveyor.
- v) There are minimum stockpiles on site, and when generated, these would be located at the lower levels and never at street level. Normally the product is immediately delivered to the client on production as preordered as we do not offer the product to any passersby clients and hence dust is minimized.

As confirmed by the ERA inspections, our site area is a relatively small sized quarry and is a very clean and neat site as the owners monitors all the movement and enforce personnel to adhere to the standard permit conditions.
