Dust Mitigation Measures

CJC Camilleri Bros Co Ltd endeavour to safeguard the environment against excessive dust in the air. The Company has always taken the following measures:

- Maintaining low stockpile heights – the management of the quarry has a policy to keep the stockpile at the lowest minimum of five working days supply of crashed spalls and sand. Once this level of stock is reached, the crashed material is loaded and transported to the company's client's plants.
- Limiting dust emissions – quarried rocks are transported to the crusher area where the rocks are 'fed' into a feeder which has installed a system of water spray that wets the rocks before these are crashed. In this way, since the rocks are wet the resulting crushed material has low dust levels.
- Working at low levels – the quarry is situated in a downhill area and work are carried out at low levels.
- The quarry site is distant from the residential area and is confined in the quarry area.
- Power-wash equipment is installed at the entrance/exit of the quarry site. Each truck exiting the site is washed.
- The road leading to the quarry has recently been refurbished and a layer of concrete was applied. The road leading to the quarry is under the responsibility of the Zurrieq Local Council, nevertheless, the Company is committed to periodically re-visit the surface of the road, especially after heavy rainfalls and patch any damage. The Company has invested also in a mechanised and industrial vacuum cleaner so that in the problematic months (Spring and Summer), the road is vacuumed every two days.

The Company tries to ensure that these mitigation measures are adhered to.

The Company give guarantees that if in the future, despite the above measures, the level of dust increases, the Company will be ready to install water sprinklers along the road in order to lower the dust levels. The water sprinklers can be installed, at regular distance on both sides of the road in a way that the whole area is covered. Moreover, a timer that switches on the wetting system every say three hours during the months of May through to September where there is the possibility of having higher levels of dust, can be installed.
